# ADHESIVE BONDED CERAMIC TILE FLOORING

## RENOPLAST DRIP EDGE PROFILES

HAVE A LOOK  
ON HOW OUR  
PROFILES ARE MADE

Renoplast is a purely Polish technological enterprise built on Polish know-how and technological thought. Driven by many years of experience and growing market demand, it has developed into a manufacturer of terrace and balcony systems for various engineering technologies and applications, which are perfectly suitable for our weather conditions.

The key element of all the systems is an aluminium edging and finishing profile with a drip edge that efficiently drives water away from the balcony or terrace. Cutting edge technology and the use of solely highest quality components resulted in products that meet even the most demanding customers' needs full anti-corrosion protection combined with attractive appearance and with all elements designed to build complete and integrated systems, whose assembly is intuitive and quick.

We have placed a high value on quality, ever since Renoplast was founded. Our unrelenting focus on quality and an innovative approach to challenges related to balconies and terraces ensure continuous development of the company and constant extension of our product range. The European Technical Assessment and a modern Qualicoat-certified paint shop support, verify and validate the direction we took many years ago. Therefore, everyone, who decides to choose the solutions proposed by Renoplast, can be sure to receive professional advice and, most importantly, a product which meets the stringent requirements for building products and fully complies with the construction law in Poland.

# PROBLEMS

**CORROSION OF DRIP  
EDGE PROFILES**

**NOT WATERTIGHT DRIP  
EDGE AREA**

**INCOMPLETENESS**

**INEFFICIENT  
WATER RUN-OFF**

# SOLUTION

## ANTI-CORROSION

All Renoplast profiles are coated compliant with the highest world standards which is Qualicoat-certified.

## WATERTIGHT

Innovative shape of the Renoplast profiles ensures that the connection of flooring with drip edge profile is fully watertight.

## COMPLETE SYSTEM

1

2

3

4

We offer straight profiles (1), connectors (2), end stops (3) and outside and inside corners (4) - of standard 90° and 135° angles. Customised angle corners and curved balcony profiles are also made to order.

## EFFICIENT WATER DRAINAGE

A unique feature of the Renoplast profiles are drainage holes to allow a discharge of water from the surface under the tiled balcony flooring. When the profiles are installed, the drain holes are positioned beneath to ensure that moisture is drawn away efficiently from under tiles.

# QUICK INSTALLATION GUIDE - K102 DRIP EDGE PROFILE

This guide provides general guidelines and is for reference only. Always refer to the instructions of the adhesive/grout/waterproofing/sealant manufacturer. Application conditions (substrate and ambient humidity, application and storage temperature, setting time of each coating, mixing ratios, etc.) must be strictly observed.

1

## Balcony or terrace screed

Balcony or terrace screed should be even and sound and have a 1.5 - 2 % slope towards the front edge. It is recommended that a 80 mm wide peripheral drop/indentation in the screed is formed to the depth of 3 mm to allow for the profile to be installed flush with the screed surface.

2

## Initial corners installation

Start with a mock installation of the corners. Put the corners in place to mark the location of the anchors, drill holes, insert the anchors in the mounting holes and fix the **NZ K102/90** corners.

### Cutting profiles

Measure straight sections to cut the **K102** profiles. Make sure that a minimum 2 mm gap is left in between the profiles at their joints as well as at the connection with the wall to allow for the end stop **OPK102**. Cut the profiles using a hand or power saw for cutting aluminium. Angle grinder must not be used as it can lead to local overheating and damage to the paint coating.

### Drilling mounting holes

Place the **K102** straight profiles, cut to the desired length, mark drill holes, drill the holes, then remove any dust and debris and insert dowel sleeves in the mounting holes.

### Corners installation

First, embed the **NZ K102/90** corners in the waterproofing and fix them to the substrate using dowels.

### Installation of straight profiles

Insert the waterproofing tape **Renoplast Clever** into the slot in the profile, allowing for overlap. Installation procedure for the **K102** straight profiles is the same as for the corners. Use builder's line stretched between the corners and a spirit level to ensure that they are aligned and flush.

7

### Connectors installation

Snap on the connectors **Renoplast LK102** in place. Tighten the dowels carefully, making sure that the waterproofing does not ooze out from under the profiles. Where necessary, add or remove excess material. Allow to set.

8

### Connection of profiles with balcony/terrace screed

To reinforce the connection between the perforated anchoring leg of **Renoplast K102** and the screed and to seal it, press the **Renoplast Clever waterproofing strip** in the waterproofing compound. To seal the joint with the doorstep use the door sealing tape with **butyl strip Renoplast PL3**.

9

### Waterproofing application

Spread the waterproof compound over the screed as instructed in the technical data sheet of the waterproofing.

**Tiling/Paving** Lay the tiles over waterproofing layer on suitable adhesive (min. C2-S1). Make sure that a minimum 5 mm gap is left between the tile edging upper lip and the tiles. A gap should also be left at the interface with the skirting and with the door.

#### **Installation of flexible joint along the drip edge profile**

Insert  $\phi 6$  mm backer rod into the gaps along the **K102** profiles, skirting and door and then seal the gaps from the top using an elastic sealing compound for exterior applications e.g. PU sealant.

## PROBLEMS

**CORROSION OF DRIP RAIL**

**INEFFICIENT WATER  
RUN-OFF**

**NO PROPER FINISHING OF  
DRIP EDGES AND SUPPORT  
FOR EDGING PROFILES**

**STRESS LEADING TO TILE  
CRACKING**

# SOLUTION

## ANTI-CORROSION

All Renoplast profiles are coated compliant with the highest world standards which is Qualicoat-certified.

## EFFICIENT WATER RUN-OFF

A unique feature of the Renoplast profiles are large drainage holes that are installed beneath the waterproofing. The profiles also features emergency overflow holes that, in the case the main drainage holes are clogged, drain water, informing the user that the main drainage holes must be cleared up.

## COMPLETE SYSTEM

We offer straight profiles (1), connectors (2), end stops (3) and outside and inside corners (4) - of standard 90° and 135° angles. Customised angle corners and curved balcony profiles are also made to order.

## FIRM AND STABLE SUPPORT FOR TILES

Except for the main function a drip profile performs i.e. efficient water shedding, it also provides a tile retaining edge to stabilise the tiles and prevent them from slipping or falling off. Drip profiles and pedestals then must be designed and produced as part of an integrated system to ensure compatibility which is guaranteed by the Renoplast systems.

## SMART SUPPORT PADS

The modular design of the **SMART** pads enables point support of the paving slabs/tiles at any point. Adjustment shims of thickness 0.5 mm, 1 mm, 2 mm do 3 mm adjust and compensate for substrate unevenness and irregularity.

# RENOPAD DECKING AND PAVING PEDESTALS

Renopad decking and paving pedestals are designed for raised or ventilated floors. Replaceable heads make them suitable both for decking boards and paving slabs. Come in 7 sizes: XXS, XS, S, M, L, XL, XXL to raise the floor level between 17 and 195 mm.

Paving support  
(2 mm spacer tabs)

Joist support  
(optional)

Skirting end stop left/right

Skirting profile C1, C2

## C1, C2 SKIRTING PROFILE

- Suitable for finishing raised floor/wall interface
- Ready for assembly with LED strips
- Available accessories like connectors and end stops
- Top profile (C2) comes only in a painted version. The set also includes a cover (frosted) for the LED strip.
- Sheet support profile (C1) or bottom profile is available solely uncoated (untreated aluminium).

# QUICK INSTALLATION GUIDE OF RENOPLAST W30 DRIP EDGE PROFILES ON BALCONY WITH EPDM WATERPROOFING MEMBRANE AND FLORING MADE OF THICK PAVERS INSTALLED ON THE SMART SUPPORT PADS

This guide provides general guidelines and is for reference only. Application conditions (substrate and ambient humidity, application and storage temperature, setting and drying time for the products applied etc.) must be strictly observed. Please refer to the information provided in the relevant technical data sheets and packaging for more details.

1

## Balcony or terrace screed

Balcony or terrace screed should be even and sound and have a 1.5 - 2 % slope towards the front edge. It is recommended that a peripheral drop/indentation in the screed, the width corresponding to the width of the installed profile (80 mm), is formed to the depth of 3 mm to ensure that the profile is installed flush with the screed surface.

2

## Surface for baseboard waterproofing

The wall area where the membrane will be installed must be smooth and sound. It can be smoothed over with base coat and reinforced with glass fibre mesh. The wall area prepared for waterproofing should be at least 15 cm above the flooring.

### Corners installation

Start with a mock installation of the corners. Put the corners in place to mark the locations of the anchors, drill holes, insert the anchors in the mounting holes and fix the **NZ W30/90** corners. Measure straight sections to cut the W30 profiles. Make sure that a minimum 2 mm gap is left in between the profiles at their joints as well as at the connection with the wall to allow for the end stops **OPW30**.

### Corners installation

First, install the **NZ W30/90** corners using an elastic sealing compound e.g. PU sealant and fix them to the substrate using dowels.

5

### Installation of straight profiles

Installation procedure for the **W30** straight profiles is the same as for the corners. When installed, cover the joints with the clip-on connectors **LW30**. Use builder's line stretched between the corners and a spirit level to ensure that they are aligned and flush.

6

### Installation of the EPDM membrane - preparation

Unroll the **EPDM Membrane** and lay out flat on the surface. Allow it to rest for 60 mins to make sure that transit creases and wrinkles are removed. Next, cut the membrane allowing for excess material to overlap the other sheets, extend onto the wall and on profiles.

### Bonding of EPDM membrane to the substrate

Work around the perimeter. Apply a 20 cm strip of the KS137 bonding adhesive to the substrate and the back of the sheet, to the wall area and profile surface. Both surfaces to be bonded must be coated with the bonding adhesive. Allow it to dry for 5-15 mins before you make the seam. Use a hand roller to press along the seam for good contact.

### Sealing the seams

Fold the membrane back approx. 2 cm and apply the sealant KS 96, roll the sealing area making sure that the sealant is not squeezed out. Seal at seams and joints with the drip edge profile **W30**.

### Sealing around balcony door

Use the prefabricated **EPDM outside corners** to seal the corners of the balcony reveal. Bond with the KS137 adhesive and seal with the KS 96 sealant. To seal the joint of the **EPDM membrane** with the doorstep install a **self-adhesive EPDM** tape with butyl strip.

### Laying paving slabs using SMART support pads

Lay flooring using **SMART** support pads. Layout of support pads varies with the tile/slab size. The layout for 60 x 60 cm slabs is presented above. Use adjustment shims of thickness 0.5, 1, 2 and 3 mm to adjust and compensate for substrate unevenness and irregularity. The shims are compatible with the **SMART** pads.

### Installation of C1 and C2 skirting profile

To provide secure connection of **EPDM membrane** turning up wall, install the skirting profile. First screw the **C1** support profile or base profile onto the wall.

Use a PU sealant to seal the gap running along the top edge of the **C1** profile and install the skirting tiles. Then screw in the **C2** top profile, mount corners and connectors. Finish with fitting in the plastic strip to cover the mounting channel of the **C2** profile. The **C2** profile is designed with a slot to accommodate the LED strip light that may illuminate the balcony/terrace floor.

# RESIN SURFACING

## PROBLEMS

**CORROSION OF  
DRIP RAIL**

**NO EFFICIENT  
WATER RUN-OFF**

**INCOMPLETE**

**LEAKING AND UNPLEASANT  
LOOKING JOINTS BETWEEN  
DRIP RAIL TRIMS**

# SOLUTION

## ANTI-CORROSION

All Renoplast profiles are coated compliant with the highest world standards which is Qualicoat-certified.

## EFFICIENT WATER RUN-OFF

A unique feature of the Renoplast profiles are drainage holes to allow a discharge of water from the surface under the tiled balcony flooring.

When the profiles are installed, the drain holes are positioned beneath allowing water to escape from the resin bound gravel.

## COMPLETE SYSTEM

We offer straight profiles (1), connectors (2), end stops (3) and outside and inside corners (4) - of standard 90° and 135° angles. Customised angle corners and curved balcony profiles are also made to order.

## WATERTIGHT JOINT BETWEEN DRIP PROFILES

Renoplast range of edging and finishing profiles provide an elegant appearance and watertight integrity to your terrace drip edge. They ensure secure and tight connection with waterproofing to efficiently drive water away from the balcony or terrace.

6. Outside gutter corner 90°/135°
7. Offset gutter angle 67°/ 87°
8. Downpipe Ø40 mm
9. Pipe clip Ø40 mm

# QUICK INSTALLATION GUIDE - K10 DRIP PROFILE EDGING THIN-COAT RESIN BONDED SURFACING

This guide is for reference only. Always refer to the instructions of the resin surfacing manufacturer. Application conditions (substrate and ambient humidity, application and storage temperature, setting time of each coating, mixing ratios of resin-hardener/catalyst etc.) must be strictly observed. This guide provides general guidelines for the three-layer solution (primer, waterproofing, top coating with sand). The decision whether to embed a fibre/mesh strip in the resin only in critical areas or over the entire surface should be as per the resin manufacturer recommendations. They may vary with top coating variants.

1

## Balcony or terrace screed

Balcony or terrace screed should be even and sound and have a 1.5 - 2 % slope towards the front edge. It is recommended that a 80 mm wide peripheral drop/indentation in the screed is formed to the depth of about 3 mm to allow for the profile to be installed flush with the screed surface.

2

## Priming

Prime the balcony or terrace screed with the concrete/cement screed primer recommended by the resin manufacturer.

3

### Initial corners installation

Start with a mock installation of the corners. Put the corners in place to mark the location of the screw anchors, drill holes, insert the anchors in the mounting holes and fix the **NZ K10/90** corners.

4

### Cutting profiles

Measure straight sections to cut the **K10** profiles. Make sure that a minimum 2 mm gap is left in between the profiles at their joints as well as at the connection with the wall to allow for the end stop **OP10/100**. Cut the profiles using a hand or power saw for cutting aluminium. Angle grinder must not be used as it can lead to local overheating and damage to the paint coating.

5

### Drilling mounting holes

Place the **Renoplast K10** straight profiles, cut to the desired length, mark drill holes, drill the holes, then remove any dust and debris and insert anchor sleeves in the mounting holes.

### Corners installation

First, embed the **NZ K10/90** corners in the resin or sealant (as instructed by the the producer) and fix them to the substrate using screw anchors.

### Installation of straight profiles

Installation procedure for the **Renoplast K10** straight profiles is the same as for the corners. Use builder's line stretched between the corners and a spirit level to ensure that they are aligned and flush. Apply an elastic sealant/mastic like PU sealant to expansion joints and install the connectors **L10/100**. Pre-tighten the anchors, making sure that the sealant does not ooze out from under the profiles.

### Connection of profiles with balcony/terrace screed

When the sealant is set, tighten the anchors. Mask the outer lip of the profile with masking tape. To reinforce the connection of the anchoring leg of **Renoplast K102** with the screed and to seal it, press a fibre/mesh strip in the resin. The fibre/mesh strip should be embedded only at the joint or over entire surface as instructed by the resin manufacturer.

9

### Installation of resin waterproofing

Apply thin-coat resin and spread over the entire balcony/terrace surface to the thickness as recommended by the manufacturer.

10

### Anti-slip quartz surfacing

Before cured, scatter dry quartz on top of the resin over the entire surface.

11

### Removal of excess quartz

Once the resin is cured sweep up excess aggregate.

### Application of smooth surface

Spread a seal coat to the entire surface to seal, bind and protect the resin bonded surfacing and prevent the sand from getting loose from the surface. It also gives the final colour to the surface. At this stage it is possible to embed decorative colour flakes. Immediately when the work is finished, remove the masking tape.

The **K10** profile front edge is 3 mm high, which makes it suitable for resin systems applied to the total thickness of 2-4 mm. This guide provides general guidelines for the three-layer solution (primer, waterproofing, sand and seal coat). The recommendations may vary with the finish variant.
